About Multisoft

Train yourself with the best and develop valuable in-demand skills with Multisoft Systems. A leading certification training provider, Multisoft collaborates with top technologies to bring world-class one-on-one and certification trainings. With the goal to empower professionals and business across the globe, we offer more than 1500 training courses, which are delivered by Multisoft's global subject matter experts. We offer tailored corporate training; project Based Training, comprehensive learning solution with lifetime e-learning access, after training support and globally recognized training certificates.

About Course

The Professional Cloud Database Engineer training by Multisoft Systems is designed to equip IT professionals and database specialists with the skills required to effectively manage and optimize cloud databases. This course provides in-depth knowledge of designing, building, and operating database solutions using leading cloud platforms, focusing on performance, security, and scalability.

Module 1: Design scalable and highly available cloud database solutions

1.1 Analyze relevant variables to perform database capacity and usage planning. Activities include:

- ✓ Given a scenario, perform solution sizing based on current environment workload metrics and future requirements
- ✓ Evaluate performance and cost tradeoffs of different database configurations (machine types, HDD versus SSD, etc.)
- ✓ Size database compute and storage based on performance requirements

1.2 Evaluate database high availability and disaster recovery options given the requirements. Activities include:

- ✓ Evaluate tradeoffs between multi-region, region, and zonal database deployment strategies
- ✓ Given a scenario, define maintenance windows and notifications based on application availability requirements
- ✓ Plan database upgrades for Google Cloud-managed databases

1.3 Determine how applications will connect to the database. Activities include:

- ✓ Design scalable, highly available, and secure databases
- ✓ Configure network and security (Cloud SQL Auth Proxy, CMEK, SSL certificates)
- ✓ Justify the use of session pooler services
- ✓ Assess auditing policies for managed services

1.4 Evaluate appropriate database solutions on Google Cloud. Activities include:

- ✓ Differentiate between managed and unmanaged database services (self-managed, bare metal, Google-managed databases and partner database offerings)

- ✓ Distinguish between SQL and NoSQL business requirements (structured, semi-structured, unstructured)
- ✓ Analyze the cost of running database solutions in Google Cloud (comparative analysis)
- ✓ Assess application and database dependencies

Module 2: Manage a solution that can span multiple database solutions

2.1 Determine database connectivity and access management considerations.

Activities include:

- ✓ Determine Identity and Access Management (IAM) policies for database connectivity and access control
- ✓ Manage database users, including authentication and access

2.2 Configure database monitoring and troubleshooting options. Activities include:

include:

- ✓ Assess slow running queries and database locking and identify missing indexes
- ✓ Monitor and investigate database vitals: RAM, CPU storage, I/O, Cloud Logging
- ✓ Monitor and update quotas
- ✓ Investigate database resource contention
- ✓ Set up alerts for errors and performance metrics

2.3 Design database backup and recovery solutions. Activities include:

- ✓ Given SLAs and SLOs, recommend backup and recovery options (automatic scheduled backups)
- ✓ Configure export and import data for databases
- ✓ Design for recovery time objective (RTO) and recovery point objective (RPO)

2.4 Optimize database cost and performance in Google Cloud. Activities include:

- ✓ Assess options for scaling up and scaling out.
- ✓ Scale database instances based on current and upcoming workload
- ✓ Define replication strategies
- ✓ Continuously assess and optimize the cost of running a database solution

2.5 Determine solutions to automate database tasks. Activities include:

- ✓ Perform database maintenance
- ✓ Assess table fragmentation
- ✓ Schedule database exports

Module 3: Migrate data solutions

3.1 Design and implement data migration and replication. Activities include:

- ✓ Develop and execute migration strategies and plans, including zero downtime, near-zero downtime, extended outage, and fallback plans
- ✓ Reverse replication from Google Cloud to source
- ✓ Plan and perform database migration, including fallback plans and schema conversion
- ✓ Determine the correct database migration tools for a given scenario

Module 4: Deploy scalable and highly available databases in Google Cloud

4.1 Apply concepts to implement highly scalable and available databases in Google Cloud. Activities include:

- ✓ Provision high availability database solutions in Google Cloud
- ✓ Test high availability and disaster recovery strategies periodically
- ✓ Set up multi-regional replication for databases
- ✓ Assess requirements for read replicas
- ✓ Automate database instance provisioning
